

THE UNIVERSAL HIDDEN HANGER BY PETIT For 6" K Style Gutter

- Deep C-Channel cross bar
- Extra metal in the back corners where you need it most
- Buttress reinforcing bend in front
- Staggered nail holes so you won't split the fascia
- Punched holes in the back for pop rivets or zip screws when you need the added support of the optional roof strap or rod and nut suspension

We have designed and tooled this hidden hanger to stand up to the demands of supporting 6" gutter on industrial and commercial buildings. It has the fit and features to give you a first class, professional installation.

We started with the nail holes. They're close enough to both catch the rafter end - so at least one is sure to hit it. They also are low enough so that they will clear the bottom of the drip edge; and because of the single thickness back, it is much easier to drive nails or screws at an angle.

The projection of the upper tab makes it simple to slip the gutter behind the drip edge. The hanger helps the gutter lie tight against the fascia to minimize leakage (note how the nails will pull it in). Rivet or zip screw hole on the top of the front lip for positive, out of sight fastening when you need maximum security against heavy loading.

The Fit and Features for a Professional Installation.
